→ subcritical pitchfork

$$\dot{x} = r x + x^3$$

	$\dot{x} = f(x; r)$	$r < 0$	$r > 0$
Saddle-node	$\dot{x} = r + x^2$	1 stable 1 unstable	None None
Transcritical	$\dot{x} = rx - x^2$	1 stable 1 unstable	1 unstable 1 stable
Pitchfork:			
Supercrit.	$\dot{x} = rx - x^3$	None 1 stable None	1 stable 1 unstable 1 stable
subcrit.	$\dot{x} = rx + x^3$	1 unstable 1 stable 1 unstable	None 1 unstable None

In practice, systems with a subcritical pitchfork bifurcation don't actually go off to $\pm\infty$ instead, higher-order terms play a stabilizing role.

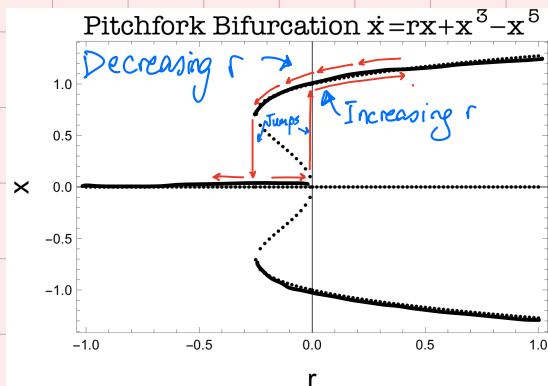

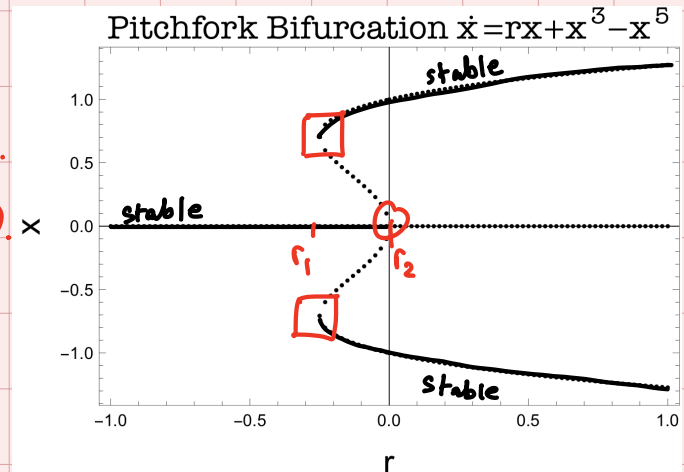

$$\dot{x} = rx + x^3 - x^5$$

for small x , this governs the dynamics.
for large x , the x^5 term plays a role also.

→ Saddle-node bifurcation at \square .

→ Subcritical pitchfork bif. at \circ .

Hysteresis
